

# UltraAmp™

Capture Sequence Cap35 / Biotin Labeled (350)  
3DNA® Dendrimer Signal Amplification Reagent

## PRODUCT INFORMATION

Catalog Number:	AC3570
Quantity of 3DNA dendrimer per vial:	3 micrograms
Targeting moiety bound to 3DNA dendrimer:	Cap35 Oligonucleotide
Capture sequence on dendrimer:	5' -TCC AAT AGA ATC ACA TCG CTT ACA AGG CAA T -3'
Label moiety bound to 3DNA dendrimer:	Biotin (~350 per dendrimer)
Dendrimer concentration:	10 nanograms of DNA per microliter
Storage conditions:	2-8° Celsius
Shelf life:	Six (6) months from the date of manufacture
3DNA Dendrimer Molecular weight:	$1.2 \times 10^7$ Daltons

## DESCRIPTION

A DNA dendrimer reagent containing Cap35 capture sequence oligonucleotide (15-30 per dendrimer molecule) and labeled with ~ 350 biotin moieties.

## STORAGE BUFFER

This UltraAmp reagent is prepared and stored in a buffered solution containing highly pure ethylene glycol, thimerosal (anti-microbial) and other proprietary stabilizer agents.

## USAGE

This reagent is effective for the detection of nucleic acid and protein targets containing the complementary nucleic acid sequence to the Cap35 capture sequence. Useful in a variety of assay formats, including ELISA and bead based flow assay formats. A quantity of 10 – 50 nanograms of dendrimer reagent per reaction is recommended; this may vary dependent upon the assay type and conditions. We recommend titrating the UltraAmp reagent for each specific assay format to determine the most appropriate quantity required per reaction. UltraAmp reagents are compatible with most assay buffers. Volume excluders, such as dextran sulfate, may be used at concentrations of up to 3% to enhance the performance of these reagents.

## APPLICATION NOTES

Application notes detailing the specific use of this product in various assay formats are available at [www.genisphere.com/signal\\_amp\\_app\\_notes.html](http://www.genisphere.com/signal_amp_app_notes.html)

## QUALIFICATION

This reagent has been qualified in a standard ELISA assay where varying quantities of an immobilized complement to the Cap35 capture sequence were detected by this UltraAmp dendrimer reagent. This assay demonstrates the ability of the UltraAmp reagent to bind appropriately to its target and provide quantifiable signal. The graph indicates the standard curve derived from the quality control testing data and does not represent the performance of this reagent in a typical sandwich immunoassay.
